

# XEROTHERMIC OAK FORESTS IN THE MIDDLE VÁH BASIN AND THE SOUTHERN PART OF THE STRÁŽOVSKÁ HORNATINA UPLAND, SLOVAKIA

M. Chytrý

Department of Systematic Botany and Geobotany, Faculty of Science, Masaryk University,  
Kotlářská 2, CZ-611 37 Brno, Czech Republic

Received for publication: April 1992

## SUMMARY

The following associations of xerothermic oak forests were recognized in the Slovakian side of the Biele Karpaty Mts., the Čachtické Hills, the Povážsky Inovec Mts., and the Strážovská hornatina Upland:

- (1) *Pruno mahaleb-Quercetum pubescantis* Jakucs et Fekete 1957 — the most xerophilous and thermophilous open forests of southern slopes on limestones and dolomites of Pannonian phytogeographical region.
- (2) *Seslerio albicanis-Quercetum pubescantis* ass. nova — xerophilous and thermophilous open forests of southern slopes on limestones and dolomites in higher altitudes under influence of Carpathian phytogeographical region.
- (3) *Corno-Quercetum* Máthé et Kovács 1962 — moderately xerophilous and thermophilous forests on limestone and dolomite slopes occurring on less xerothermic habitats and in marginal areas of the Pannonian phytogeographical region.
- (4) *Festuco heterophyllae-Quercetum* Neuhäusl et Neuhäuslová-Novotná 1964 — moderately xerophilous and thermophilous forests on sunny slopes on poor crystalline rocks, representing a transition to oak-hornbeam forests.
- (5) *Potentillo albae-Quercetum* Libbert 1933 — moderately thermophilous forests of flat terrain on loamy substrata with changeable soil humidity regime.

## INTRODUCTION

Phytosociological investigations of xerothermic oak forests were carried out in various areas of Slovakia (Nevole 1931, Dostál 1933, Klika 1937, 1938, Futák 1947, Michalko 1957, Jakucs 1961, Neuhäusl et Neuhäuslová-Novotná 1964, 1967, Neuhäuslová-Novotná et Neuhäusl 1965, Neuhäuslová-Novotná 1965, 1968, Šomšák et Háberová 1979 etc.). Extensive syntaxonomical literature on this topic originates from neighbouring Hungary (Zólyomi et Jakucs 1957, Jakucs et Fekete 1957, Jakucs 1961, Soó 1963 etc.). From the middle Váh basin and the southern part of the Strážovská hornatina Upland, phytosociological data on this vegetation were published by Klika (1937), Futák (1947), Jakucs (1961), and Maglocký (1979). However, syntaxonomy and actual distribution of the vegetation mentioned had remained unknown in this area. The present paper tries to overcome this gap.

## METHODS

For the description of the vegetation, traditional methods of the Zürich-Montpellier school (Braun-Blanquet 1964, Westhoff et van der Maarel 1978) were used. Relevés were taken using a

7-grade scale of abundance and dominance ( $-$ ,  $+$ ,  $1, 2, 3, 4, 5$ ). The classification of associations is based on the table synthesis (Braun-Blanquet 1964), but also the position of particular relevés on the scatter diagram of DECORANA ordination (Hill 1979, Hill et Gauch 1980) has been taken into account. The nomenclature of plant species follows Neuhäuslová et Kolbek (1982).

## AREA UNDER STUDY

The area under study includes the middle part of the Slovakian side of the Biele Karpaty Mts., approximately between the villages of Pruské and Moravské Lieskové, the Čachtické Hills in the northernmost promontory of the Malé Karpaty Mts., marginal areas of the middle and northern parts of the Povážský Inovec Mts. and the eastern and southern marginal parts of the Strážovská Upland.

Geologically, the Biele Karpaty Mts. are composed of flysch facies of Paleocene and Eocene ages. Along the southeastern margin of the flysch runs the klippen belt composed of Jurassic and Cretaceous limestones. The Čachtické Hills consist predominantly of Triassic dolomites and limestones, only in the southern part limestones of Cretaceous age are present. The mountain ridge of the Povážský Inovec Mts. consists of nutrient-poor gneisses of Cambrian and Pre-Cambrian ages and granitoids. In lower marginal parts Upper-Paleozoic and Mesozoic sediments occur, of which Triassic dolomites and limestones are the most important. The Strážovská hornatina Upland is composed predominantly of limestones and dolomites of Triassic, Jurassic and Cretaceous age. Basins between mountain systems are overlaid by Neogene deposits and locally also by loess.

Climatic conditions of the area are under strong orographical control. The Váh valley has warm to moderately warm, moderately dry to humid intermontane basin climate with great temperature inversion; mean temperature of January ranges from  $-2$  to  $-5^{\circ}\text{C}$ , that of July from  $17$  to  $20^{\circ}\text{C}$  with mean annual precipitation of  $600$ – $800$  mm. In the lower mountain areas where the thermophilous oak forests occur, warm to moderately cool, humid to very humid montane climate with small temperature inversion predominates; mean temperature of January is  $-2$  to  $-6^{\circ}\text{C}$ , that of July  $16$ – $19.5^{\circ}\text{C}$ , mean annual precipitation  $600$ – $900$  mm. Lowlands in the southern part of the Váh basin and in the Bebrava basin have prevalently warm, dry to moderately dry lowland climate with mean temperature inversion; mean temperature of January is  $-1.5$  to  $-4^{\circ}\text{C}$ , that of July  $18.5$ – $19.5^{\circ}\text{C}$ , mean annual precipitation  $650$ – $700$  mm (Michalko et al. 1986).

## RESULTS: DESCRIPTION OF SYNTAXA

*Pruno mahaleb-Quercetum pubescentis* Jakucs et Fekete 1957 (Tab. 1, rel. 1–30)

Syn.: *Quercetum lanuginosae pannonicum* Dostál 1933 p.p. (Art. 34); *Dictamno-Sorbetum* Knapp 1942 p.p. (Art. 1); *Quercetum pubescentis praecarpaticum* sensu Futák 1947 p.p., non Klika 1937 (Art. 34); *Quercetum pubescentis praecarpaticum* subass. with *Cotinus coggygria* Futák 1947 p.p. (Art. 34); *Querceto-Torminaleatum orientale* Jurko 1951 (Art. 34); *Quercus pubescens-Lithospermum purpureo-coeruleum* Michalko 1957 (Art. 36); *Quercetum pubescentis caricetosum humilis* Michalko 1957 (Art. 36); *Cotino-Quercetum pubescentis seslerietosum variae (praecarpaticum)* (Futák 1947) Jakucs et Fekete ex Jakucs 1961 (syntax. syn.); non: *Lathyro versicoloris-Quercetum pubescentis* Klika (1928) 1932.

Nomenclatural typus: Michalko (1957): pp. 69–71, tab. 6, relevé 1 (lectotypus *hoc loco*).

The dwarfish forest stands with an open canopy, dominated by *Quercus pubescens*, with *Q. virgiliana* also present. The shrub layer consists especially of thermophilous species, e.g. *Cornus mas* and *Viburnum lantana*. The herb layer is rich in species; those of steppe habitats prevail. Dominants of this layer are

*Brachypodium pinnatum*, *Carex humilis*, *Vincetoxicum hirundinaria*, and *Festuca rupicola*. The ground cryptogam layer is scarce.

It usually occurs on large areas on sunny slopes of southern aspects in lower altitudes in the warmest parts of the territory under study. The soils are rendzinas on limestones or dolomites, often very shallow with islets of protruding parent rocks.

The stands of this community were recorded in the Čachtické Hills, on limestone hillocks near Nové Mesto n. Váh., in the Tematínske Hills, in the Kňaží stôl mountain group and in the southern promontories of the Strážovská hornatina Upland between Uhrovec and Partizánske. An isolated locality was recorded on the limestones of the klippen belt near Krivoklát village in more northern part of the Váh basin (Fig. 1).

From the territory under study, stands belonging to this association were described by Sillinger (1931), Futák (1947), Jakucs (1961), and Maglocký (1979). From a more southern part of the Malé Karpaty Mts., data exist from Plavecké Podhradie and Plavecký Peter villages (Jakucs 1961, Neuhäuslová-Novotná 1970).

Classification of the stands from the area under study into the association *Cotino-Quercetum pubescantis* (Soó 1931) Zólyomi, Jakucs et Fekete ex Jakucs 1961 (Jakucs 1961) is not well-founded because the only western Slovakian locality of *Cotinus coggygria* is Smradlavý vrch hill near Timoradza where it occurs in a stand undoubtedly belonging to the association *Pruno mahaleb-Quercetum pubescantis*. From the phytogeographical point of view, the *Cotino-Quercetum pubescantis* is typical of the Transdanubian part of the Hungarian Medium Range (cf. Jakucs et Fekete 1957, Zólyomi 1958, Jakucs 1961 etc.) and it does not occur in Slovakia at all.

***Seslerio albicanis-Quercetum pubescantis* ass. nova hoc loco (Tab. 1, rel. 31-41)**

Syn.: *Quercetum pubescantis praecarpaticum* sensu Futák 1947 p.min. p., non Klika 1937 (Art. 34); non: *Cotino-Quercetum pubescantis seslerietosum variae (praecarpaticum)* (Futák 1947) Jakucs et Fekete ex Jakucs 1961.

Nomenclatural typus: tab. 1, relevé 34 (holotypus hoc loco).

Open and dwarfish forest stands dominated by *Quercus pubescens* and hybrids of *Q. dalechampii* × *pubescens*, accompanied by *Fagus sylvatica*. Dominant shrubs of usually scarce understory are *Cornus mas* and *Sorbus aria*. In the herb layer, *Carex humilis*, *Sesleria albicans*, and *Inula ensifolia* predominate. Many species of Carpathian flora are present in the stands: *Acinos alpinus*, *Polygala amara* subsp. *brachyptera*, *Carduus glaucinus*, *Pulsatilla subslavica*, *Phyteuma orbiculare*, *Galium austriacum*, etc. The ground layer is poorly developed.

The community vicariates with the preceding one along an altitudinal gradient and in the areas under stronger influence of the Carpathian flora. It is typical of the sunny slopes with southern aspect in moderately higher altitudes. Usually it forms small islets surrounded by limestone or dolomite beech forests. The soils are rendzinas on limestone or dolomite, usually shallow, only several cm thick.

The stands of this association occur only in the Strážovská hornatina Upland (Fig. 1).

From the materials published in literature, relevé 2 in tab. III in Futák (1947) belongs to this association.

**Corno-Quercetum** Máthé et Kovács 1962 (Tab.1, rel. 42–53)

Syn.: *Quercetum lanuginosae pannonicum* Dostál 1933 p.p. (Art. 34); *Quercetum pubescentis praecarpaticum* Klika 1937 p.min.p. (Art. 34); *Quercetum pubescentis praecarpaticum* sensu Futák 1947 p.p., non Klika 1937 (Art. 34); *Dictamno-Sorbetum* Knapp 1942 p.p. (Art. 1); ass. *Quercus petraea-Lithospermum purpureo-coeruleum* sensu Michalko 1957, non Br.-Bl. 1932 (Art. 31); *Corneto-(Lithospermo-) Quercetum* Jakucs et Zólyomi in Zólyomi et Jakucs 1957 p.p. (Art. 2b, 10); non: *Lithospermo-Quercetum* Br.-Bl. 1932.

Nomenclatural typus: Máthé et Kovács (1962): p. 317, tab. 2, relevé 1 (lectotypus hoc loco).

The canopy is composed mainly of *Quercus petraea* s.l., sometimes, especially in stands neighbouring on *Pruno mahaleb-Quercetum pubescentis*, *Q. pubescens* s.l. is also present. Dominant understorey shrubs include *Cornus mas* and *Crataegus monogyna*. The herb layer is usually dominated by *Melica uniflora* which is accompanied besides the *Quercion pubescenti-petraeae* species by many species typical of oak-hornbeam forests (*Campanula rapunculoides*, *Brachypodium sylvaticum*, *Asarum europaeum*, *Lathyrus vernus*, etc.). *Laser trilobum* may also be a dominant species of the herbaceous understory. In the ground layer, only several mosses with low cover degree occur.

The *Corno-Quercetum* is a community representing the transition from carbonate xerothermic oak forests to oak-hornbeam forests on limestone substrata which were described by Michalko (1983) as an association *Hacquetio-Carpinetum betuli* from the Biele Karpaty Mts. In low-lying areas where it links up with the *Pruno mahaleb-Quercetum pubescentis*, it occurs on cooler and more humid slopes of eastern and western aspects and in habitats with temperature inversion in valleys etc. In higher altitudes, it forms islets among oak-hornbeam forests (usually *Carici pilosae-Carpinetum* Neuhäusl et Neuhäuslová-Novotná 1964). The bedrock is formed of limestone, the soils developed on it are slightly deeper and more humic than in the case of the two foregoing associations.

The most abundant occurrence of this association was recorded on limestones of the klippen belt in the Biele Karpaty Mts. Further it occurs in the Povážsky Inovec Mts. and the southern part of the Strážovská hornatina Upland (Fig. 1).

From the territory under study, this community was recorded by Klika (1937) and Futák (1947).

**Festuco heterophyllae-Quercetum** Neuhäusl et Neuhäuslová-Novotná 1964 (Tab. 1, rel. 54–55)

Nomenclatural typus : Neuhäusl et Neuhäuslová-Novotná (1964): pp. 24–27, tab. III, relevé 32 (lectotypus hoc loco).

*Quercus petraea* s.l. stands with scarce shrub layer. Herbaceous understory is dominated by *Poa nemoralis* and *Festuca heterophylla*. Species of xerothermic oak

and oak-hornbeam forests tolerating acid soil are also present. The ground layer is scarce.

The *Festuco heterophyliae-Quercetum* represents a transitional vegetation between acidophilous xerothermic oak forests and oak-hornbeam forests. It occurs on sunny southern slopes on acid crystalline rocks. The soils are only several cm thick rankers with high content of gravel.

The community is rare in the territory under study. Its distribution is limited to the marginal parts of the Povázský Inovec Mts. on crystalline bedrock (Fig. 1).

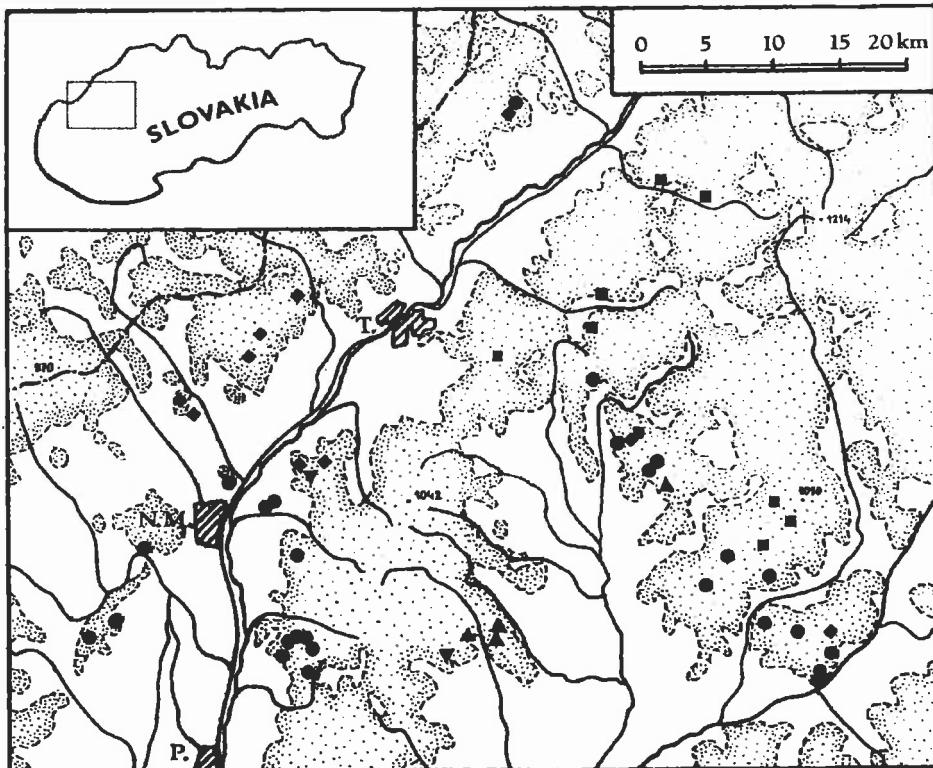

Fig. 1. Localities of relevés of xerothermic oak forests in the middle Váh basin and the southern part of the Strážovská hornatina Upland (● *Pruno mahaleb-Quercetum pubescens*, ■ *Seslerio albantis-Quercetum pubescens*, ◆ *Corno-Quercetum*, ▼ *Festuco heterophyliae-Quercetum*, ▲ *Potentillo albae-Quercetum*).

It is reported by Neuhäuslová-Novotná (1970) from the southern part of the Malé Karpaty Mts.

#### *Potentillo albae-Quercetum* Libbert 1933 (Tab. 1, rel. 56–59)

Nomenclatural typus: Libbert (1933): pp. 297–299, tab. XXV, relevé 1 (lectotypus hoc loco).

Forests with high, almost closed canopy formed of pure *Quercus petraea* s.l. Presence of scattered understory of small shrubs, dominated by *Frangula alnus*, is typical. In the herb layer, *Festuca heterophylla*, *Fragaria moschata*, *Melampyrum pratense* and *Poa nemoralis* prevail. Species of habitats humid in spring and dry in summer are typical of this community (*Molinia caerulea*, *Potentilla alba*, *Selinum carvifolia*, etc.). The ground layer has low cover of mosses, *Dicranella heteromalla* typically occurs in these stands.

Typical community of xerothermic oak forests on substrata with changeable humidity regime. It occurs on flat terrain or on moderate slopes on Neogene sediments, loess, and loess loams.

The stands of this association were recorded in the marginal parts of the Bebrava basin bounded by the Povážský Inovec Mts. and the Strážovská hornatina Upland (Fig. 1). In the past, this community was probably widespread in the Bebrava basin in which agricultural land predominates at present.

## LOCALITIES OF RELEVÉS

### *Pruno mahaleb-Quercetum pubescens*

1. Krivoklát, SE slopes 0.8 km W of the village, altitude 450 m, aspect WSW, inclination  $45^\circ$ , cover  $E_3=70\%$ ,  $E_2=50\%$ ,  $E_1=70\%$ ,  $E_0=5\%$ , sample area  $200\text{ m}^2$ , 31.5.1991.
2. Slatinka nad Bebravou, S slopes 1 km NW of the village, 460 m, S,  $20^\circ$ , 50 %, 40 %, 70 %, 1 %,  $200\text{ m}^2$ , 24.5.1991.
3. Timoradza, S slopes of Smradlavý vrch hill 1.8 km NE of the village, 280 m, SSW,  $30^\circ$ , 40 %, 40 %, 80 %, 0 %,  $100\text{ m}^2$ , 6.6.1991.
4. dtto, 280 m, SSW,  $5^\circ$ , 80 %, 20 %, 80 %, 5 %,  $100\text{ m}^2$ , 6.6.1991.
5. Timoradza, S slopes of a range between Kňaží stôl and Ostrý vrch hills 3.8 km ESE of the village, 480 m, SW,  $20^\circ$ , 80 %, 30 %, 80 %, 5 %,  $200\text{ m}^2$ , 21.6.1991.
6. Lutov, S slopes of Ostrý vrch hill 1.8 km N of the village, 480 m, SSE,  $15^\circ$ , 70 %, 20 %, 80 %, 5 %,  $200\text{ m}^2$ , 21.6.1991.
7. Trenčianske Bohuslavice, SE slopes of Turecký vrch hill above the railway 1.5 km S of the village, 270 m, SW,  $25^\circ$ , 90 %, 60 %, 70 %, 5 %,  $200\text{ m}^2$ , 18.5.1991.
8. dtto, 290 m, S,  $10^\circ$ , 80 %, 70 %, 60 %, 5 %,  $200\text{ m}^2$ , 18.5.1991.
9. Kálnica, S slopes 1 km NNW of the village, 280 m, SSE,  $5^\circ$ , 90 %, 70 %, 50 %, 5 %,  $200\text{ m}^2$ , 27.5.1991.
10. Kálnica, SE slopes 1.3 km WNW of the village, 240 m, ESE,  $20^\circ$ , 70 %, 70 %, 60 %, 5 %,  $100\text{ m}^2$ , 27.5.1991.
11. Kočovce, S slopes of Sochoň hill 2.3 km E of the village, 460 m, S,  $10^\circ$ , 70 %, 50 %, 50 %, 5 %,  $100\text{ m}^2$ , 16.5.1991.
12. Uhroveč, S slopes of Jankov vršok hill 2.3 km ESE of the village, 470 m, SE,  $20^\circ$ , 70 %, 40 %, 90 %, 3 %,  $200\text{ m}^2$ , 22.6.1991.
13. Dolné Vestenice, S slopes 1.3 km NNE of the village, 440 m, SSE,  $10^\circ$ , 80 %, 30 %, 80 %, 5 %,  $200\text{ m}^2$ , 16.6.1991.
14. Miežgovce, S slopes of Ostrý vrch hill 2.5 km E of the village, 430 m, SSW,  $30^\circ$ , 70 %, 30 %, 80 %, 10 %,  $200\text{ m}^2$ , 22.6.1991.
15. Dolné Vestenice, SE foothills of Chotoma hill 2 km S of the village, 300 m, SE,  $30^\circ$ , 60 %, 60 %, 80 %, 10 %,  $100\text{ m}^2$ , 16.6.1991.
16. Nitrica, S slopes of a range 0.5 km WSW of Stráže hill 2.5 km SW of the village, 300 m, S,  $15^\circ$ , 70 %, 10 %, 80 %, 10 %,  $200\text{ m}^2$ , 16.6.1991.

17. Chalmová, S slopes O.7 km W of the village, 320 m, S,  $15^\circ$ , 70 %, 15 %, 80 %, 10 %, 200  $m^2$ , 16.6.1991.
18. Osłany, S slopes of Velký vrch hill 2.3 km NW of the village, 430 m, ESE,  $30^\circ$ , 80 %, 20 %, 60 %, 5 %, 200  $m^2$ , 16.6.1991.
19. dtto, 440 m, ESE,  $20^\circ$ , 80 %, 40 %, 70 %, 5 %, 200  $m^2$ , 16.6.1991.
20. Višňové, S slopes above the Jablonka creek 2 km NE of the village, 370 m, SW,  $30^\circ$ , 60 %, 30 %, 80 %, 5 %, 200  $m^2$ , 20.5.1991.
21. dtto, 350 m, S,  $35^\circ$ , 70 %, 50 %, 80 %, 5 %, 200  $m^2$ , 19.5.1991.
22. Čáštovce, SE foothills of Velký Plešivec hill 3 km WNW of the village, 300 m, SW,  $10^\circ$ , 80 %, 40 %, 70 %, 3 %, 200  $m^2$ , 19.5.1991.
23. Krajné, S slopes of Salášky hill 2.7 km ESE of the village, 430 m, S,  $10^\circ$ , 90 %, 50 %, 60 %, 5 %, 200  $m^2$ , 19.5.1991.
24. Lúka, S slopes between Ihelník hill and Tematín castle 3.4 km NE of the village, 480 m, SSE,  $20^\circ$ , 90 %, 60 %, 70 %, 1 %, 200  $m^2$ , 26.5.1991.
25. Lúka, SW slopes below Tematín castle 4 km NE of the village, 500 m, SW,  $20^\circ$ , 80 %, 40 %, 80 %, 3 %, 200  $m^2$ , 26.5.1991.
26. Stará Lehota, SW slopes of Kňažný hill 2 km NW of the village, 550 m, SW,  $10^\circ$ , 90 %, 70 %, 70 %, 3 %, 200  $m^2$ , 26.5.1991.
27. Lúka, E slopes between Ihelník and Bôrovište hills 2.8 km NE of the village, 370 m, E,  $20^\circ$ , 80 %, 40 %, 80 %, 0 %, 200  $m^2$ , 26.5.1991.
28. Lúka, S slopes of Bôrovište hill 2.2 km NE of the village, 390 m, S,  $25^\circ$ , 90 %, 60 %, 60 %, 3 %, 200  $m^2$ , 26.5.1991.
29. Stará Lehota, SW slopes of Rovence hill 1.5 km WSW of the village, 460 m, SSW,  $20^\circ$ , 80 %, 30 %, 80 %, 0 %, 200  $m^2$ , 26.5.1991.
30. dtto, 450 m, SW,  $15^\circ$ , 80 %, 40 %, 80 %, 0 %, 200  $m^2$ , 26.5.1991.

*Seslerio albicantis-Quercetum pubescens*

31. Veľké Košecké Podhradie, S slopes above the road crossing 1 km W of the village, 400 m, S,  $40^\circ$ , 40 %, 20 %, 70 %, 5 %, 200  $m^2$ , 22.5.1991.
32. dtto, 420 m, ESE,  $35^\circ$ , 50 %, 20 %, 80 %, 5 %, 200  $m^2$ , 22.5.1991.
33. Kopec, S slopes above the road crossing 2.2 km N of the village, 450 m, SSE,  $25^\circ$ , 40 %, 10 %, 90 %, 0 %, 100  $m^2$ , 22.5.1991.
34. Omšenie, SW slopes of Baba hill 1 km NE of the village, 500 m, SW,  $45^\circ$ , 40 %, 30 %, 80 %, 10 %, 200  $m^2$ , 5.6.1991.
35. Omšenie, S slopes in Baske Nature Reserve 2.8 km S of the village, 650 m, S,  $40^\circ$ , 70 %, 30 %, 80 %, 10 %, 150  $m^2$ , 2.6.1991.
36. dtto, 650 m, SSE,  $35^\circ$ , 60 %, 30 %, 80 %, 0 %, 200  $m^2$ , 2.6.1991.
37. Kubrica, S slopes above the Kubrica creek 2.3 km ESE of the village, 550 m, SSE,  $45^\circ$ , 50 %, 15 %, 90 %, 3 %, 400  $m^2$ , 15.5.1991.
38. Timoradza, SW slopes of Udrina hill 2.5 km ENE of the village, 570 m, S,  $2^\circ$ , 50 %, 40 %, 80 %, 40 %, 200  $m^2$ , 21.6.1991.
39. Uhrovské Podhradie, S slopes of a valley 3 km E of the village, 800 m, S,  $25^\circ$ , 70 %, 5 %, 70 %, 5 %, 200  $m^2$ , 22.6.1991.
40. Uhrovské Podhradie, S slopes 0.5 km SW of the summit of Malý Rokoš hill 4 km E of the village, 900 m, S,  $30^\circ$ , 50 %, 20 %, 80 %, 5 %, 150  $m^2$ , 22.6.1991.
41. Uhrovec, S slopes of a range between Jankov vršok and Holý vrch hills 3.5 km E of the village, 580 m, SSW,  $15^\circ$ , 60 %, 10 %, 80 %, 2 %, 200  $m^2$ , 22.6.1991.

*Corno-Quercetum*

42. Krivoklát, E slopes of Košariská valley 2 km SW of the village, 420 m, ESE,  $30^\circ$ , 80 %, 70 %, 50 %, 0 %, 200 m<sup>2</sup>, 31.5.1991.
43. Krivoklát, SW slopes of Košariská valley 1.7 km SW of the village, 450 m, SW,  $40^\circ$ , 90 %, 60 %, 70 %, 5 %, 200 m<sup>2</sup>, 31.5.1991.
44. Drietoma, S slopes 2 km NNW of the village, 640 m, SSW,  $35^\circ$ , 80 %, 20 %, 80 %, 5 %, 150 m<sup>2</sup>, 1.5.1991.
45. Kochanovce, S slopes of Horné bradlo hill 4.5 km NW of the village, 540 m,  $20^\circ$ , 90 %, 60 %, 70 %, 5 %, 200 m<sup>2</sup>, 13.5.1991.
46. Melčice, S slopes of Lukovský vrch hill 4.7 km NW of the village, 540 m, S,  $20^\circ$ , 80 %, 40 %, 80 %, 0 %, 200 m<sup>2</sup>, 21.5.1991.
47. Zemianske Podhradie, S slopes of Hlohová hill 2 km W of the village, 520 m, S,  $40^\circ$ , 90 %, 40 %, 60 %, 10 %, 200 m<sup>2</sup>, 20.6.1991.
48. Zemianske Podhradie, SE slopes of Lysica hill 1 km SW of the village, 400 m, SSE,  $20^\circ$ , 70 %, 60 %, 80 %, 10 %, 200 m<sup>2</sup>, 20.6.1991.
49. Krivosúd-Bodovka, SW slopes of the Humništia hill 2 km SSE of the village, 450 m, SW,  $15^\circ$ , 80 %, 60 %, 70 %, 0 %, 200 m<sup>2</sup>, 19.6.1991.
50. Beckov, a plateau 2.5 km NE of the village, 360 m, WSW,  $5^\circ$ , 90 %, 50 %, 80 %, 5 %, 200 m<sup>2</sup>, 30.5.1991.
51. Timoradza, SW slopes of Udrina hill 2.5 km ENE of the village, 450 m, WSW,  $20^\circ$ , 60 %, 50 %, 80 %, 10 %, 200 m<sup>2</sup>, 6.6.1991.
52. dtto, 550 m, SSE,  $15^\circ$ , 90 %, 10 %, 80 %, 30 %, 200 m<sup>2</sup>, 21.6.1991.
53. Nitrica, SW foothills of Drieňový vrch hill 2.5 km SSE of the village, 500 m, WSW,  $10^\circ$ , 90 %, 20 %, 70 %, 10 %, 200 m<sup>2</sup>, 16.6.1991.

*Festuco heterophyliae-Quercetum*

54. Beckov, SW slopes of Lašid hill 2.5 km E of the village, 420 m, SW,  $5^\circ$ , 80 %, 10 %, 80 %, 10 %, 200 m<sup>2</sup>, 30.5.1991.
55. Podhradie, SW slopes above the Slivnica creek 1 km NE of the village, 370 m, SSW,  $25^\circ$ , 90 %, 0 %, 70 %, 3 %, 200 m<sup>2</sup>, 23.6.1991.

*Potentillo albae-Quercetum*

56. Ľutov, forest 1.2 km E of the village, 310 m, S,  $5^\circ$ , 90 %, 10 %, 60 %, 5 %, 200 m<sup>2</sup>, 21.6.1991.
57. Malé Hoste, forest 1.2 km SW of the village, 330 m, SSW,  $5^\circ$ , 80 %, 20 %, 80 %, 5 %, 200 m<sup>2</sup>, 23.6.1991.
58. Nemečky, forest 1.2 km W of the N margin of the village, 320 m, -,  $0^\circ$ , 80 %, 20 %, 80 %, 3 %, 200 m<sup>2</sup>, 23.6.1991.
59. Nemečky, forest 0.8 km ENE of the N margin of the village, 310 m, SE,  $5^\circ$ , 70 %, 10 %, 90 %, 5 %, 200 m<sup>2</sup>, 23.6.1991.

## ACKNOWLEDGEMENTS

I am indebted to P. Deván, K. Devánová and I. Škodová (Trenčín) for their informations on some localities, J. Kobližek (Brno) for determination of specimens of genus *Quercus*, I. Novotný (Brno) for determination of a part of moss specimens, V. Grulich (Brno) for his phytogeographical and taxonomical comments on some species and to Czechoslovak Army for accomodation during the field research.
